

**Gain More Control with NControl's Suite of Management System Solutions:**

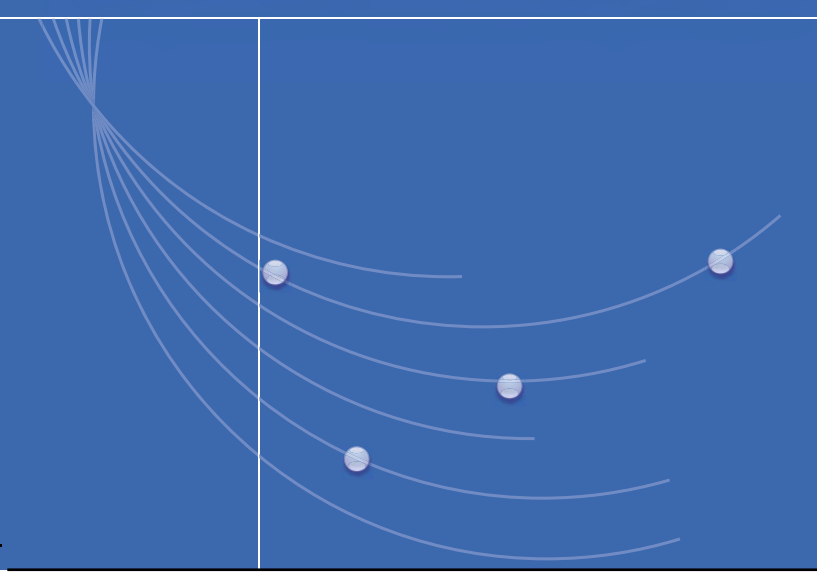

- Real-Time Accountability
- Independent Hardware Solutions
- Added Security and Monitoring
- Shared Data with Existing Applications
- Streamlined Business Practices

Make your investment count for something! NControl incorporates the hardware systems you already own and streamlines them into a sophisticated management system without the capital outlay you'd expect for such convenient control. Yes, it's that easy. Customizable solutions. Software driven applications. Intuitive visual interface. All resulting in more control of your business units' top priorities...integrated management systems at your fingertips.

*Achieving Integrated Control Solutions.*

◆ **Inventory Management**

Get beyond the basics! NControl's applications deal with extensive asset management capabilities down to the last detail! Applications include Parent/Child associations, based on highly effective 'rule sets' to track, monitor and manage high value assets to ensure they are being moved or otherwise transported only by authorized personnel.

◆ **Controlled Access**

Providing real-time accountability of authorized personnel and visitors, NControl's intuitive design monitors the database activity for tag events: reader location, time, direction of travel, movement of vehicles/personnel or for emergency assembly reporting.

◆ **Yard Management**

Manage plant operations according to your specifications - timed entry, lighting, alert messages, map of facility, data grid or spatial diagrams and more. Flexibility and forward-thinking design allows the user to locally monitor activity at multiple locations.

◆ **Safety & Security**

Defend against theft and terrorism - recruit advanced software for tighter control of your most sensitive environments. Meet impending OSHA requirements with specialized software that gives you the capability to observe asset network traffic, events and alerts with a summary of network conditions. Safety and security managers are quickly able to determine whether all onsite personnel have been accounted for during disaster situations.

◆ **Legacy Databases**

NControl's applications can transfer event information by way of Ethernet or WebClient based connections to other systems or databases. The application allows total control of the size, structure and content of the transferred information. It is easily integrated with legacy or custom applications that require collected data for operations.

◆ **Event Management**

NControl's unique approach to managing real world events allows flexible applications to interact with personnel and facilities. We use an innovative, baseline event model as the foundation for all our applications which can then be customized for specific events and business processes. Additions to the standard model (i.e. weight, contents, parking spots) will be automatically updated in all other NControl applications or 3rd party systems.
